(P5.1) $\mathrm{COP}=$ coef. of performance $=\frac{\underline{Q}_{C}}{W_{S, \text { net }}}$
Using state numbers of Fig 5.8-5.9. P-H plot will look like Fig 5.9. Use P-H chart and table from Appendix E. Saturated values are from the table:
state 2 is satV at $-40 \mathrm{C} \rightarrow \mathrm{H}_{2}=372 \mathrm{~kJ} / \mathrm{kg}$ (chart)
state 3 , outlet of the reversible compressor is found by following the isentropic line to 40 C , where $\mathrm{H}_{3}{ }^{\prime}=438 \mathrm{~kJ} / \mathrm{kg}$.
state 4 is satL at $\mathrm{H}_{4}=256 \mathrm{~kJ} / \mathrm{kg}$ (table)
state $1, \mathrm{H}_{1}=\mathrm{H}_{4}$
$Q_{C}=\left(H_{2}-H_{1}\right)=372-256=116 \mathrm{~kJ} / \mathrm{kg}$
$\mathrm{W}_{\mathrm{S}}=\left(H_{3}-H_{2}\right)=438-372=66 \mathrm{~kJ} / \mathrm{kg}$
$\Rightarrow C O P=\frac{\dot{\underline{Q}}_{C}}{\underline{\dot{W}}_{S}}=\frac{116}{66}=1.76$
$\underline{Q}_{C}=\operatorname{COP}\left(\mathrm{W}_{\mathrm{S}}\right)=1.76(9000 \mathrm{~J} /$ day $)=16 \mathrm{~kJ} /$ day
(P5.2) Methane,. See Fig 5.8-5.9. Methane chart Appendix E.
$T_{\text {evap }}=-280^{\circ} F, P=0.032 \mathrm{MPa}$
$\Rightarrow H_{2}^{\text {sat } V}=339 \mathrm{Btu} / \mathrm{lbm}$
$S_{2}^{s a t V}=2.35 \mathrm{Btu} / \mathrm{lb} .{ }^{\circ} \mathrm{F}$
Pressure of 3' isn't given, however, it will be the same as the condenser outlet $\left(\mathrm{P}_{4}\right)$ since the condenser will be considered to be isobaric. State 4 will be satL at 40 F , so $\mathrm{P} 4=\mathrm{P} 3{ }^{\prime}=$ 2 MPa . Follow isentropic line from the compressor inlet state to 2 MPa . At P3' $=2 \mathrm{MPa}$, and $\mathrm{S3}^{\prime}=2.35 \mathrm{Btu} / \mathrm{lb}_{\mathrm{m}} \mathrm{F}, \mathrm{H} 3^{\prime}=485 \mathrm{Btu} / \mathrm{lbm}$, and $\mathrm{T}^{\prime}=40 \mathrm{~F}$. At the outlet of the condenser, the fluid will be saturated liquid at 2 MPa ,
$T_{4}=-160^{\circ} F, P_{4}=2 \mathrm{MPa}$
$\Rightarrow H_{4}^{\text {satL }}=218 \mathrm{Btu} / \mathrm{lbm}$
$S_{4}^{\text {sat } l_{l q}} 1.54 B t u / l b .{ }^{\circ} F$

| State | T( ${ }^{\circ} \mathrm{F}$ ) | P (MPa) | H(Btu/lb) | $\mathrm{S}\left(\right.$ Btu/lb*$\left.{ }^{\text {º}} \mathrm{F}\right)$ |
| :---: | :---: | :---: | :---: | :---: |
|  | -280 | 0.032 | 218 |  |
| 2 Sat'd vap | -280 | 0.032 | 339 | 2.35 |
| $3^{\prime}$ | 40 | 2 | 485 | 2.35 |
| 4 | -160 | 2 | 218 | 1.5 |

$C O P=\frac{H_{2}-H_{1}}{H_{3}^{\prime}-H_{2}}=\frac{Q_{C}}{W_{S, \text { net }}}=\frac{H_{2}-H_{4}}{H_{3}^{\prime}-H_{2}}=\frac{339-218}{485-339}$
$\Rightarrow C O P=0.83$
(P5.3) Rankine Cycle, Fig 5.2
temperatures $200^{\circ} C \& 99.6^{\circ} C$, Sat vapor from Turbine outlet can be found in the Sat Pressure table Appendix E.

The turbine is assumed to be adiabatic and reversible since no other specifications are given. The inlet state will then have the same entropy as the outlet. Since the boiler/superheater outlet is to operate at $\mathrm{T}_{3}=200 \mathrm{C}$, and $\mathrm{S}_{3}=7.3592$, we must hunt in the superheated tables to find this combination. This will occur between 0.2 and 0.3 MPa . Interpolating, the value of H can be found. Values are tabulated below:

| State | T $^{\mathbf{O}} \mathbf{C}$ | $\mathbf{P ( M P a )}$ | $\mathbf{H}(\mathbf{k J / k g})$ | $\mathbf{S ( k J / k g * K})$ | $\mathbf{V}(\mathbf{m 3 / k g})$ |
| :--- | ---: | ---: | ---: | ---: | ---: |
| 4' sat vap | 99.6 | 0.098 | 2675 | 7.359 |  |
| 5 sat liq. | 99.6 | 0.098 | 417 | 1.3028 | 0.001043 |
| 3 | 200 | 0.271 | 2867 | 7.3592 |  |
| 6 |  |  | 417.18 |  |  |

$$
\begin{aligned}
& W_{S, \text { turbine }}^{\prime}=\left(H_{4}^{\prime}-H_{3}\right)=2675-2867=-192 \mathrm{~kJ} / \mathrm{kg} \\
& \Delta H_{\text {pump }}=W_{S, \text { pump }}=\int V d P=V \Delta P \\
& \Rightarrow \Delta H_{\text {pump }}=\frac{1043 \mathrm{~cm}^{3} *(0.271-0.098)}{\mathrm{kg}} * \frac{1 \mathrm{~J}}{\mathrm{~cm}^{3} * M P a} * \frac{\mathrm{~kJ}}{10^{3} \mathrm{~J}} \\
& \Rightarrow \Delta H_{\text {pump }}=0.180 \mathrm{~kJ} / \mathrm{kg} . \\
& \Rightarrow W_{S, \text { net }}^{\prime}=-192+0.180=-191.82 \mathrm{~kJ} / \mathrm{kg} \\
& \& \eta=\frac{-W_{S, \text { net }}^{\prime}}{Q_{\text {boiler }}}=\frac{-(-191.82)}{\left(H_{3}-H_{6}\right)}=\frac{-(-191.82)}{\left(2867-H_{6}\right)} \\
& \Rightarrow H_{6}=417+0.18=417.18 \mathrm{~kJ} / \mathrm{kg} \\
& \Rightarrow \eta=\frac{-(-191.82)}{(2867-417.18)}=0.0783 \\
& \Rightarrow \eta=7.83 \%
\end{aligned}
$$

(P5.6) Inlet: $300 \mathrm{psia} / 14.504=20.68 \mathrm{bar} ;\left(550{ }^{\circ} \mathrm{F}+460\right) / 1.8-273.15=288^{\circ} \mathrm{C}=561.15 \mathrm{~K}$ Steam.xls $=>$ H1 $=2993.9 ;$ S1 $=6.7004$
Outlet: $\mathrm{S} 2=1.3072+0.95(7.3541-1.3072)=7.053 ; \mathrm{H} 2=419.17+0.95 * 2256.4=2562.8$
$\mathrm{W}=2562.8-2993.9=-431.1$
$\mathrm{S}^{\prime}{ }^{\prime}=\mathrm{S} 1=>\mathrm{q}^{\prime}=(6.7004-1.3072) /(7.3541-1.3072)=0.8919$
$\mathrm{H}^{\prime}{ }^{\prime}=419.17+0.8919^{*} 2256.4=2431.7=>\mathrm{W}^{\prime}=2431.7-2993.9=-562.2$
$\Rightarrow \eta_{E}=431.1 / 562.2=76.7 \%$
(b) Base Rankine cycle on actual turbine $=>\mathrm{Wp}=1.9 \mathrm{~J} / \mathrm{g} ; \mathrm{QH}=2993.9-(419.17+1.9)=2572.8$ $\eta \theta=(431.1-1.9) / 2572.8=16.7 \%$
